Data:	SSMP MA. / Examination Version: 13.11.2018 Start Year: SoSe 2019 number: 51119
Module Name:	Simulation of Sustainable Metallurgical Process
(English):	Simulation of Sustamable Metanurgical Frocess
Responsible:	Stelter, Michael / Prof. DrIng.
responsible.	Reuter, Markus / Prof. Dr.
Lecturer(s):	Reuter, Markus / Prof. Dr.
Institute(s):	Institute for Nonferrous Metallurgy and Purest Materials
Duration:	1 Semester(s)
Competencies:	In the course the participants will learn:
Competencies.	Simulation of reactor types
	 modelling and simulation of hydro- and pyrometallurgical reactors for primary and secondary resources and determination of mass and energy balances as well as minerals processing determination of ecological and economic footprint of reactors
	2. Modelling of processing flowsheets
	 develop processing flowsheets for non-ferrous metal containing resources modelling and simulation of hydro- and pyrometallurgical processing plants for primary and secondary non-ferrous resources as well as minerals processing determination of mass and energy balances of the complete flowsheet and determine optimal processing routes determination of ecological and economic footprint of complete flowsheets
	3. Methods and tools
	 use of simulation tools such as HSC Sim 9.0, FACTSAGE etc. and environmental software tools such as GaBi to evaluate different processing options create process designs and communicate results to a client and/or stakeholders e.g. NGOs
Contents:	Reactor types in process metallurgy and minerals processing (e.g. TSL, Kaldo, flash smelting, QSL, flotation cells etc.) will be compared using simulation cases, evaluated and optimised for metal and minor metal recovery. The environmental footprint as also the economic performance of each reactor type will be compared with each other to establish best options for reactor flotation types as a function of feed types. The student will understand minerals processing and metallurgical reactor technology better and also be in a better position to create more sustainable industry and society. Process design cases will be performed by the students to optimally process different feed types. By using a wider range of reactor types the student will be able to simulate complete flowsheets, provide mass and energy balances at the same time also determine the environmental
	footprint as well as economic analysis. This course will also examine the impact of product design on the recycling of various end-of-life products such as mobile phones etc. Thus, not only will natural resources be processed in the simulated systems but also materials from the "urban

	mine". Therefore, this course will also use this rigorous simulation basis to critically discuss environmental legislation as well as communicate these results to all stakeholders. The course takes place as a 2 week block course in September.

Types of Teaching:	S1 (SS): Block course / Lectures (1 SWS) S1 (SS): Block course / Seminar (2 SWS) S1 (SS): Block course / Practical Application (2 SWS)
Pre-requisites:	Recommendations: Basic thermodynamic, thermodynamic and kinetic knowledge in process metallurgy
Frequency:	yearly in the summer semester
	For the award of credit points it is necessary to pass the module exam. The module exam contains: AP: Report of simulation The student should solve a case/example and hand in the computer file as a document.
Credit Points:	6
Grade:	The Grade is generated from the examination result(s) with the following weights (w): AP: Report of simulation [w: 1]

Workload: The workload is 180h. It is the result of 75h attendance and 105h self-studies.
